SAMSUNG UNIVERSITY HACKATHON · THEME 02

FIXORA

Smart Guided Troubleshooting Engine

From vague complaints to guided solutions.

TEAM

TRACK

Theme 02

Users describe symptoms, not solutions

"My phone became very slow after the update."

Everyday language. No category, no cause, no setting name.

Samsung's own support guidance for a slow phone spans several different areas — storage, updates, restarts, Device Care — so one sentence can point in many directions.

User complaint

Vague, colloquial

Ambiguous language

"slow" = lag? battery? storage?

Multiple possible causes

Update, storage, background apps

Generic search results

Long articles, forums, mixed devices

User confusion

Which step? In what order? Did it work?

FIXORA turns a complaint into a guided fix

Understand

Reads the complaint and extracts category, symptom and trigger.

Guide

Delivers actions one step at a time, in a defined order.

Structure

Represents the issue as fields the system can act on — not free text.

Verify

Asks whether the device is working normally before closing the session.

Target architecture — and what runs today

MVP Implemented **MVP · BASIC** Rule/catalog based today **PLANNED** Target architecture, not yet built

From colloquial text to structured fields

INPUT

"My phone became very slow after the update"

STRUCTURED ISSUE

device	Galaxy device
category	Performance
symptom	Device is slow
trigger	Software update

Narrows the search space

Category decides which part of the action catalog applies.

Enables ordering

Trigger + symptom let the engine pick a sensible first step.

Machine-readable

Every later stage consumes fields, not raw sentences.

Not a list of tips — a guided session

“FIXORA doesn’t just tell users what to do. It walks them through the fix, one validated step at a time.”

Simple, typed, and API-first

Frontend

React
Vite
CSS

Guided Fix UI, progress, verification

Backend

Python
FastAPI
Pydantic

Classification, action catalog, sessions

API

REST
JSON

Structured troubleshooting plan

Development

Git
GitHub

Version control, team workflow

PLANNED

LLM-based structure extraction

Semantic cache

Official challenge deeplink catalog

One sentence in, one guided fix out

Design choices, not benchmark claims

MVP

Structured issues

Vague complaints become fields.

MVP

Ordered actions

Steps follow a defined sequence.

MVP

Step-by-step Guided Fix

One action at a time, with progress.

MVP

Built-in verification

Asks if the problem is solved.

MVP

Machine-readable JSON

Structured JSON over a REST API.

PLANNED

Samsung action map

Designed for the official catalog.

PLANNED

Semantic cache

Fast path for repeated issues.

Honest about what runs today

CURRENT MVP

- ✓ Query enrichment (basic)
- ✓ Category classification
- ✓ Symptom & trigger extraction
- ✓ Predefined action catalog
- ✓ FastAPI REST API
- ✓ Guided Fix sessions + progress
- ✓ Verification step
- ✓ React / Vite frontend

TARGET / FUTURE

- Two-stage LLM engine
- Official challenge deeplink catalog
- Fast-path semantic cache
- Full challenge datasets & schema
- Production deployment
- Expanded device / action coverage

Official assets (queries.json, sis_responses.json, deeplinks.json, samples/, schema.py) are not yet available to the team.

Where FIXORA goes next

Official deeplink integration

Map actions using the supplied catalog only.

Two-stage LLM processing

Enrich, then extract — schema-validated.

Semantic similarity cache

Reuse plans for paraphrased queries.

Larger knowledge base

More issues and troubleshooting actions.

More device categories

Beyond phones — tablets, wearables.

Confidence-based fallback

Ask a clarifying question when unsure.

Production deployment

Hosting, monitoring, rate limiting.

Analytics & feedback

Learn which steps actually resolve issues.

Personalised flows

Adapt steps to device state and history.

All items on this slide are planned — none are part of the current MVP.

FIXORA transforms troubleshooting from searching for answers into following a guided solution.

Thank You
